GOVE3

GOVE3 – DROOP ENGINE CONTROL MODULE

GOVE3 upgrades the Engine Control Module (ECM) on GEH models to give a frequency droop characteristic.

The droop control module contains a load sensor as well as an engine speed sensor. The module allows the engine speed to decrease as the load increases.

In paralleling systems, the frequency and speed are held by the system. The droop control module's attempt to reduce speed results in the generating set transferring load to the other power sources in the system.

Option GOVE3 is required when using GEH models in paralleling applications.
