GOVE1 – ELECTRONIC GOVERNOR

The standard mechanical governor regulates the steady state generating set speed within $\pm 0.8\%$, with a speed droop from no load to full load of 4%.

Fitting an electronically governed actuator improves the steady state speed to within $\pm 0.25\%$ to provide isochronous frequency regulation typically required when supplying electronic or other non-linear loads.

GOVE1 is available on GEP80SP1, GEP100 and GEPX100.
